

**Thou shalt not snoop around in other people's computer files.**

If you manage to hack into someone's system (for the right reasons, eg if you a grey hat hacker, then respect their privacy and don't look at their personal files. This could be looking at their bank records or stealing photos and posting them on the internet for all to see.

**Thou shalt not use a computer to steal.**

Once you have broken into a system, don't use that to find their bank details and steal money directly out of their account. Also, don't use that computer as a pass through for your illicit activities, so it looks like they are doing the hacking/cracking not you. This also means that you cannot download illegal content.

**Thou shalt not use other people's computer resources without authorization or proper compensation.**

You will not use the compromised computer to do illegal activities, thus making people/authorities think that the owner is behind the attacks. You also cannot use this computer to become part of a DDOS attack, thus using their CPU and internet resources without their consent.

**Thou shalt not appropriate other people's intellectual output.**

You cannot steal files that are written by someone else and make them seem like they are yours. This affects such things as software code, important legal/business documents and friends assignments!!! You can't use people website design but downloading all the html/images/css etc and turn that into your site without their consent.
